## DATA SHEET

EX1200-3048
48-CHANNEL 300 V/2 A MULTIPLEXER

## EATURES

High-density 300 V/2 A multiplexing scanning (up to 288 two-wire channels in 1 U footprint)

High current bank available for curren
measurement up to 3 A
Two individual ( $1 \times 24$ ) 2 -wire multiplexer banks programmably combinable to form a $1 \times 48$ multiplexer

Configure as 2 - or 4 -wire multiplexers under program control
internal capacitive discharge relays keep high voltages from disturbing sensitive measurement points

Supports thermocouple, RTD, and thermisto
measurements
Optional screw-terminal junction box includes
built-in cold-junction compensation
Direct routing to DMM through internal analog
measurement bus simplifies field wiring

## OVERVIEW

The EX1200-3048 is a high-density multiplexer modules designed for scanning of multiple points to a common bus, in either 2 - or 4 -wire configurations. Scanning can be done either synchronously with the EX1200 DMM scan function or asynchronously as a system switch to other devices through the hardware trigger bus or LXI LAN messages.

Applications include cable harness testing, temperature/voltage monitoring, PCB testing, and those in which multiple points need to be switched to a common resource. All relays also have individual control, and each path allows for hot switching of up to 300 V and 2 A ( 60 W DC max). Two dedicated channels have the capability to directly measure current up to 3 A.

The EX1200-3048 consists of dual ( $1 \times 24$ ) 2-wire multiplexer banks. Each bank can be interconnected within a module under program control (via bussing relays) to form a 1 48 multiplexer. The EX1 200 analog bus can be used to configure larger multiplexers which eliminates external wiring and helps reduce unterminated stub effects. Up to 288 two-wire (or 144 four-wire) channels can be accommodated in a single EX1200 full rack mainframe for maximum density or mixed and matched with other EX1 200 plug-ins for flexibility,

Internal residual voltage discharge relays can be enabled to momentarily short out the measurement path when changing from one input channel to the next. This dissipates any voltage held by the wiring and instrument input capacitance. These relays protect sensitive devices, such as CMOS circuits, from residual voltages caused by previous high-voltage measurements. This feature can also be disabled in low-voltage applications where maximum throughput speed is important.

An optional terminal block provides screw termination points for external field wiring This terminal block also includes cold junction compensation reference for more precise temperature measurements.

$<-55 \mathrm{~dB}$
$<-45 \mathrm{~dB}$
$<-30 \mathrm{~dB}$
104-pin
Notes:

1. Maximum switched power is derated non-linearly as voltage is increased
2. This value is in reference to a resistive load. Minimum capacity changes depending on switching frequency and environmental conditions
