### Site flow indicator benefits include;

- High visibility rotor
- Cost effective
- 5 flow ranges
- Chemically resistant
- Compact
- Stainless steel body
- Choice of end fittings

### Site flow indicator ideal for;

- Coolant monitoring
- Test rigs
- Oil flow
- Local indication

Indicators of fluid flowing have been used ever since man began using liquids for his own purposes. The mill owner would use a calibrated measure to check the height of his millpond and hence the amount of water/power available. In more recent times petrol pumps used to be manufactured with a rotating paddle in a sight glass dome showing that you were actually getting petrol as you were being served. Often the use of a flowmeter is an over-kill as all that is required is a quick check that the system is working and fluid is flowing. These indicators are suitable for flows up to 30 litres per minute and may be fitted with a choice of connectors that

are simply locked into the stainless steel body. The whole assembly can then be rotated to ensure the best line of sight for the flowing liquid.
